Blanc, V., Blanche, F., Crouzet, J., Jacques, N., Lacroix, P.,
Thibaut, D., Zagorec, M., Debussche, L. and De Crecy-Legard, V.
Polypeptides involved in the biosynthesis of streptogramins,
nucleotide sequences coding for these polypeptides and their use
Patent: US 5891695-A 42 06-APR-1999;
Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 (bases 1 to 38)

Watkins H, Rosenzweig A; Seidman J, Seidman C, WPI; 1995-245715/32. Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(8).

Example 1; Col 10; 22pp; English

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hyperrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing

oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain

The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hyprid double strands (RNA from the normal gene, DNA from the suspect sample). FHC associated point mutation can be classified and used to determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonuclectides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonuclectide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two
asymptomatic individuals suspected of having the disease. The method has a broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B, Duchenne's muscular dystrophy, sickle cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a mutation

DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is sepecially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease, phenylketonuria or cystic fibrosis. The present sequence is a nested PCR primer used to amplify a region of the beta cardiac myosin heavy chain cDNA containing an FHC-associated mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an amplified product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligomiclectide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligonuclectides
                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, beta cardiac myosin, heavy chain, PCR; primer, ss, FHC, SHC,

c diagnosis of hypertrophic cardiomycathy (comprising a first container holding an RNA probe completely hybridisable to the beta-cardiac myosin heavy chain DNA, where the RNA probe is capable of detecting a character and the second container and hypertrophic cardiomyopathy associated mutation, a second container by hypertrophic cardiomyopathy associated mutation, a second container conforms for amplifying beta-cardiac myosin heavy-chain DNA and instructions for using the components of the kit to detect the presence or absence of a hypertrophic cardiomyopathy contain DNA). The method is used for detecting the presence or absence of a mutation associated with cardiomyopathy for facilitating the diagnosis of for hypertrophic cardiomyopathy. Presently, the diagnosis of individuals hypertrophic cardiomyopathy relies on the presence of typical cardiomyopathy. Presently, the diagnosis of individuals hypertrophy. The present invention is non-invasive and based, at least in chart, on the discovery that hypertrophic cardiomyopathy is caused by point mutations in the beta cardiac myosin heavy-chain gene. Prior art creveals that there are no extensive studies involving a large number of families which established that this particular disease or disorder was caused by point mutations in the beta cardiac myosin heavy-chain gene.

The present sequence is a PCR primer used to amplify a region of the beta and is and in the beta cardiac myosin heavy-chain gene. which amplify beta-cardiac myosin heavy-chain DNA (the set of objorucialeotide primers being useful for facilitating the disanosis of hypertrophic cardiomyopathy by being capable of detecting a hypertrophic cardiomyopathy by being capable of detecting a hypertrophic cardiomyopathy-associated mutation) and a kit for facilitating the chain having a disease-related point mutation. cardiac myosin heavy

Analyzing multiple targets in polynucleotide, by providing multiple primers with target nucleic acids, digesting nucleic acid products with cognate restriction enzymes, amplifying digested products, and detecting amplified products.

Example 1; SEQ ID NO 28; 65pp; English

The invention relates analysing multiple targets in polynuclectide, involves providing a set or sets of multiple primers with target nucleic acids in separate reactions of primer setension or amplification, where the acids in separate reactions of products in that each nucleic acid fragments comprise at least one restriction sites with cognate to products of the separate reactions on the restriction sites with cognate reactions together, where randomly joining nucleic acid fragments from the separated reactions are created, amplifying the joined products, and detecting the amplified products. Also included are an oligonucleotide primer for detecting transparently products. Also included are an oligonucleotide of primer for detecting arget nucleic acid sequence (comprising as included are an oligonucleotide or primer for detecting arget nucleic acid sequence (comprising as a fetterion marker in the process of detecting trattic manipulation on restriction site of reaction product is captured; manipulation on restriction site of reaction product is indicative of the presence of target nucleic acid sequence) and a kit for use in analysis and detection of multiple targets in a polynucleotide (comprising as set or sets of multiple primers, universal primers, creatriction enzymes, and dorsal primers, universal primers, creatriction enzymes, but and for genotyping mutations, preferably single cucle from any source. The method enables analysis of multiple cargets genomic methylation patterns and any specific cargets from any source. The method enables analysis of multiple targets defined acids from any source. The method enables analysis of multiple cargets quantitatively. An experiment was performed, using the method of the invention, where 8 SNPs were detected in human genomic DNA.

                                                                                                                                                                                                                                                                          ð
                                         The present sequence is that of downstream primer 9/97.10 used in the PCR amplification of open reading frame 3 (DRF3) of swine reproductive and respiratory syndrome virus (PRRS). It is based on the 3' end of the PRRS ORF3, and introduces an EcoRI site at the 3' end of the gene. The PCR product was used in the construction of homology vector 934-64.2, which incorporates a beta-glucuronidase marker gene and the PRRS ORF3 gene incorporates a beta-glucuronidase marker gene and the PRRS ORF3 gene incorporates a beta-glucuronidase marker gene and the PRRS ORF3 gene purpose of inserting foreign DNA into recombinant RPV. Recombinant RPVs of the invention have foreign DNA intestred into non-essential regions of the RPV genome. They can be included in vaccines against animal pathogens, useful for immunising animals (especially avian species or mammals, including humans) against animal pathogens (claimed), e.g. felline pathogens (claimed) or human inmunodeficiency virus, human influenza etc. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; PCR primer; ss.

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nested PCR primers (AAT48848-51) were designed to obtain a full-length coding sequence for rat brain adenosine kinase (AK). These primers bind to the 5' and 3' untranslated regions of the gene. Rat brain cDNA was initially amplified with outer primers (AAT48849, AAT48849), AAT48851). The PCR fragment was cloned into pGEM-T and inserts from multiple clones were sequenced. A full-length consensus sequence (AAT48843) coding for rat brain AK (AAM08369) was obtd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat brain, and human placenta short and long forms of adenosine kinase - used. e.g. for assaying for AK (ant)agonists or for prodn. of monoclonal antibodies against AK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a PCR primer for DNA encoding the rat brain adenosine kinase (AK) of the invention. Cells transformed with the DNA are used to produce recombinant AK. The AK is used: (i) to screen for specific agonists and antagonists; (ii) to raise antibodies; and (iii) the rapeutically (reduced levels of AK are associated with resistance to nucleoside analogues with cytotoxic, anticancer and antiviral properties, with liver tumours, gout and acquired immune deficiency syndrome). Fragments of the DNA sequence are used as primers and probes to screen ban libentifying AK-encoding nucleic acid, also as antisense therapeutics (particularly to increase local adenosine concentrations at the site of tissue injury, increasing the level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention provides human and murine recombinant Zipper Interacting Protein Kinase (ZIP-kinase) proteins. These proteins are serine/threonine kinases which bind the leucine Zipper domain of transcription factor ATF4. Host cells containing vectors comprising the ZIP-kinase nucleic acids are used for the recombinant expression of the proteins. ZIP-kinase protein and DNA are useful as gene therapeutic agents against cancer, and as anti-cancer agents
                                                                                                                  Zipper Interacting Protein Kinase; ZIP-kinase; serine/threonine kinase;

```

The invention relates to a novel human guanosine monophosphate reductase GMRR2, and the polymucleotide encoding it. The zymological activity and the relationship of GMPR2 and tumour cell multiplication and cell differentiation are verified. The invention also discloses the strategy of resisting GMPR2 for diagnosing and curing diseases, specially for

```
squence, which is a polynucleotide comprising sequences which, when introduced into a cell either predisposed to undergo cell death or in the process of undergoing cell death, prevent, delay, or rescue the cell from death, relative to a corresponding cell into which exogenous nucleic acids have been introduced. The sequences of the invention are useful for diagnosing a protective sequence-mediated condition, disorder or disease in an individual. The treatable disorders are preferably of the central nervous system of humans including ischaemia-related conditions such as stroke, cerebral herniation, septic embolism, cerebral codema, infections such as meningitis, protezoal infections such as malaria, metazoal infections such as meningitis, protezoal infections such as malaria, metazoal concephalopathy, conditions involving the eye such as macular desentation, diabetic retinopathy, trauma such as epidural hematoma, tumours such as primary intracranial tumours, degenerative diseases such as Alzheimer's disease and nutritional, environmental and metabolic conditions. Sequences AAS98409-AAS98544 represent human protective

```
Telomerase promoter-controlled recombinant viruses proliferating specifically in tumor cells to highly express antioncogene to kill tumor cells by synergism, applicable in treating tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel recombined virus for specific proliferation and efficient expression of an anticancer gene in tumour cells. By inserting a telomerase promoter in the upstream area of an early virus gene, the recombinant virus is made to proliferate selectively in tumour cells with telomerase activity rather than in normal reals without telomerase activity. This recombinant virus may be used to treat several kinds of tumours. This sequence represents a PCR primer used to illustrate the method described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HGFL; RON; MSP; transmembrane; glycoprotein; receptor tyrosine kinase; hepatotropic; liver; hepatocyte growth factor-like protein; human; macrophage stimulating protein; mutagenic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a recombination virus proliferating in a tumour cell, which can express an anti-oncogene with high efficiency. The invention also relates to the method of its proliferation. A telomerase promoter controlling the transcription of at least one necessary gene for a recombination virus proliferating, can make the virus optionally proliferate in a tumour cell, which has the activity of telomerase and passically does not proliferate in a normal cell without the activity of a telomerase. The recombination virus can be used in therapy of many kinds of tumours. This polynucleotide sequence represents a PCR primer relating to the specific proliferation in a tumour cell of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Telomerase promoter-controlled recombinant viruses proliferating specifically in tumor cells to highly express antioncogene to kill tumor cells by synergism, applicable in treating tumor.

                                                                                                                                                                                                                                                                                                                                                                                                                                          d
                                                                                                                                                                                                          The invention relates to a pharmaceutical composition that comprises heterodimeric transmembrane glycoprotein (RON) receptor tyrosine kinase inhibitor with at least one additional component selected from carriers, adjuvants, emulaifiers, solubilizers and stabilizers. The compositions phase action of RON receptor tyrosine kinase in the liver physiology; the composition can be used in the treatment of hepatobiliary damage e.g. acute and chronic liver failure; for preventing hepatobiliary damage due to exposure to hepatotoxic agent (preferably anesthetic, neuropsychotropics, anticonvulsants, analgesics, antimicrobials, neuropsychotropics, anticonvulsants, analgesics, antimicrobials, commones, cardiovascular drugs, immunosuppressives, radation and antineoplastic agents). It is also useful in the treatment and prevention of injury and diseases or liver, biliary tract, bile ducts, gall bladder developing liver damage due to drug overdose, accidental exposure to infected blood samples, aggressive chemocherapy or liver infected blood samples, aggressive chemocherapy or liver infected blood samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                   Pharmaceutical composition useful in prevention and treatment of hepatic disorders comprises heterodimeric transmembrane glycoprotein receptor tyrosine kinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                    Sequences ABV75114-125 represent mutagenic oligonucleotides used for creating mutant forms of the human hepatocyte growth factor-like protein (HGFL), also known as macrophage stimulating protein (MSP)

specific replication in tumour cells, comprising a nucleotide sequence encoding an antibody or its fragment for treating a tumour. The invention functoring application of the virus for killing or inhibiting tumour cells after external infection of such cells with an effective dose of the virus; treating human tumours by external or internal infection of the tumour cells to limit their replication and upgrowth with selectivity after expressing a dose of the antibody or its fragment, with increase of the number of copies of the encoded nucleotide sequence if necessary, for direct killing of such tumour cells, and inhibiting proliferation of tumour, its growth and transfer; use of the virus to inhibit proliferation of tumour cells; use of virus producing remedies for treating a tumour; and drug compositions containing the recombinant virus and plaramecutically-acceptable carriers. The recombinant virus has any platatic activity. The viruses are applicable for killing or inhibiting tumour cells when used in drug compositions to treat tumours. This polynucleotide sequence represents a primer used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
Recombinant viruses for expressing anti-tumor antibody or its fragment with high efficiency in tumor cells to kill or inhibit proliferation and transfer of tumors, useful in drug compositions to treat tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human gene coding sequence, its coded polypeptide and preparation
                                                                                                                                                                                                                                              invention relates to a novel recombinant virus that is capable of

               purification of the protein from Chinese Hamster Ovary (CHO) host cells. Myx is a member of the Mad family of proteins which interact with c-myc. The sequence was isolated from a lambda gtll cDNA library. The cDNA and protein can be used for further researching action of Mad family proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, uncleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; drug metabolising enzyme; gene; drug metabolism; chromosome 11; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to CT drugs. SNRs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur can mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the cyprocation of adverse reactions, thereby increasing safety. The would not only take the guesswork out of selecting the drug with the cyproval processes. For example, individuals could be selected for capable of responding to a particular drug of ascovery and approval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of the invention may therefore lead to a an increase in the range of the invention may therefore lead to a time taken for a drug to be approved, the length of time patients are on medication and the number of different confications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Compositions and compositions for identifying individuals who have at least one polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50887 using a variety of detection assays, including hybridiation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of arrays and PCR-based methods. The invention also encompasses methods of carrays and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide coplymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to chugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases, conditions, occur DNA sequence variations and human diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur char cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations cut as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolishing enzymes allows the customistion of drug therapies based upon the genetic profile of individual parients.

This would not only take the quesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Wethods of the invention are also useful in the drug discovery and appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of the invention may therefore lead to a an increase in the ranger of drug trials of the propertions, failed drug trials, the time taken for a drug deserved for the line patients are on medication or drug classe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                    Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its compounded is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid for the analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or dot-comparisons of any gene, in mapping the 5' termini of mRNA molecules by primer extensions of any sequenced. The sequence or specific or unclaic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                            New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises or hybridising at least one or more nucleic acid states and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, corr family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises is useful in in situ hybridisation, in Southern, Northern or dot-probes is useful in in situ hybridisation, in Southern, Northern or dot-probes is useful and pervised in mapping the 5' terminiof mannaly sequence or specific for additional subclones containing segments of DNA that have been containing segments of DNA that have been mucleic acid probes incorporated in the microarray. Note: The sequence and precipitally sequenced. The sequence presented is one of the mucleic acid probes incorporated in the microarray. Note: The sequence or sequence the uncleic acid probes incorporated in the microarray. Note: The sequence or sequence and probes incorporated in the microarray. Note: The sequence the sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or sequence or se

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY5941 represent novel Neiseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54571 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisserial abacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mouse, phage display, anti-inflammatory, antibody therapy, inflammatory bowel disease; rheumatoid arthritis; septic shock; multiple sclerosis, chronic inflammation; allograft rejection; panning; tumour necrosis factor alpha; TNF; CDR3; complementarity determining region; hybridoma; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                      ò
                                                                                                                                          which was used for large scale production of VH single-domain molecules.
A phage library was generated from a gene isolated from a mouse hybridoma. Phage clones contained a random sequence coding for 9 amino acids in the third hypervariable loop (CDR3). CDR3 typically makes most antigen contacts in antibody combining sites. Phage clones capable of binding a specific antigen, e.g. Tumour necrosis factor alpha (ThRalpha), were selected by library panning. The present sequence was used to reamplify plasmid DNA from positive-binding clones in order to insert cloning sites for subcloning into the T7 promoter-based pFT-21a expression vector. Protein was expressed at high levels in BL21 cells upon IPTG induction and accumulated in intracellular inclusion bodies which could then be isolated and purified. Single-domain VH proteins can be used to treat or diagnose disorders associated with the antigens that they bind to. For example, disorders in which TNF plays a role include inflammatory bowel disease, rheumatoid arthritis, septic shock, multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide sequence encoding multiple drug resistance proteins from Drosophila melanogaster or Anopheles gambiae, useful in developing effective insecticides.
                                                              Small functional units of antibody heavy chain variable regions useful for diagnosis and treatment of disease.
                                                                                                                                 present sequence is an oligonucleotide designated pET-21aVH3'XhoI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAQ90435-Q90441 are RT-PCR primers used for the production of anti-idiotype antibody clones of Idio3, Idio17, Idio20, Idio27 and Idio33 against a human anticancer monoconal antibody. These antibodies and DNA encoding them are useful in pharmacological, medical and biochemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                          Gaps
The present invention relates to a purified polynucleotide or its fragment and comprises a sequence encoding multiple drug resistance protectins (MRPs) from Drosophila melanogaster or Anopheles gambiae. I polynucleotide is useful in developing effective insecticides. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  monoclonal

The present invention describes the variable heavy and light chain regions (I) of murine monoclonal antibody (mAB) 1F7. AAY91014 to AAY91016 chain. Pepresent specifically claimed amino acid sequences of the variable light chain, and AAY91017 to AAY91019 represent specifically claimed amino acid sequence of the variable heavy chain. The antibodies are used for treatment of HIV (human immunodeficiency virus) infection and AIDS (acquired immunodeficiency syndroms). They are also used for detecting HIV in serum and for stimulating HIV antigen related and committed B cells to produce broadly reactive and neutralising antibodies by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Variable heavy and light chain regions of murine monoclonal antibody 1F7,
                                                                                                                                                                                                                                               The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. Sequences AAZ58665-688 represent PCR primers used in the course of the invention for constructing the anti-CD4 antibody 4H5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1F7 antibody; murine; monoclonal antibody; diagnosis; HIV; infection; AIDS; anti-HIV; human immunodeficiency virus; detection; acquired immunodeficiency syndrome; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel device (I) for separating cluster differentiation (CD) positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leuwenic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. AZ44207-24230 represent PCR primers used to illustrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to anti-human immunoglobulin B (IgE) monoclonal antibody selected the monoclonal antibodies 4D3, 1A7, 3E8, 4D10, and 11D10, which combine specifically to human IgE. The monoclonal antibody can be used for the detection of human IgE. The present sequence was used in an example from the present invention
clonotypic stimulation. The present sequence represents a PCR primer used in the amplification of the murine monoclonal antibody 1F7

New polynucleotide encoding a complementarity- or framework-determining region of an anti-idiotypic antibody that binds to human or primate antihuman immunodeficiency virus (HIV) antibodies, for use in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to coding sequences of the murine 1F7 antidictypic antibody complementarity-determining region (CDR) or framework-determining region (FR). The antibody binds to human or primate antihuman immunodeficiency virus (HIV) antibodies and can be used in the treatment of HIV infection. The present sequence is a PCR primer used to isolate a 1F7 coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ligand binding; restriction enzyme; nucleic acid determination; pharmaceutical; BamHI; ss.

The invention provides a method for determining the sequence of polymucleotide flanking regions that modulate ligand binding characteristics of an adjacent binding site. The method comprises: (i) providing a number of different duplex polymucleotides, each having the same polymucleotide ligand binding site and a randomly synthesised sequence flanking the binding site; (ii) exposing the duplex to a ligand selective for the binding site; (ii) isolating duplexes which bind or do not bind the ligand, and (iv) determining the nucleotide composition of the flanking duplex sequence by sequencing the duplex sequence adjacent to the binding site. The invention is used to modulate the ligand-binding and more efficient than prior art techniques that moderate ligand binding using small molecule pharmaceuticals. Sequences AAS9576-296170 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TREM-like transcript-1; septic shock; cancer; infectious disease; stroke; heart disease; myocardial infarction; arteriosclerosis; clotting disorder; bleeding disorder; platelet insufficiency; TLT-1 associated disorder; gene therapy; antibacterial; immunosuppressive; cytostatic; antimicrobial; cerebroprotective; vasotropic; cardiant; antiarteriosclerotic; haemostatic; murine; RT-PCR;

                                The present invention relates to a triggering receptor expressed on maloid cell (TREM)-like transcript-1 (TTT-1) polypeptides and the encoding polymucleorides, where the TTT-1 polypeptide can modulate platelet function. The invention is useful for preventing, diagnosing and tracating a disorder, e.g. septic shock, cancer, infectious disease, stroke, heart disease, myocardial infarction, arteriosclerosis, clotting disorders, platelet insufficiency or a TLT-1 present sequence is the murine TREM DNA specific reverse transcription (RT)-PCR primer. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         altered alphavins (AV nonstructural protein 2 (nsp2) gene which when incorporated into an AV replicon particle (ARP) has a reduced level of vector-specific RNA synthesis, increases the time required to reach 50% inhibition of host cell-directed macromolecular synthesis when expressed in mammalian cells and persistently replicates when introduced into mammalian cells, as compared to wild-type ARP. The sequence can be used to deliver a selected heterologous sequence to a vertebrate or insect cell, where it can produce AV replicon particles and make a desired protein, for example erythropoletin, basic fibroblast growth factor, factor VIII, vascular endothelial growth factor and tissue plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid having altered alphavirus nonstructural protein 2 gene which when operably incorporated into alphavirus replicon particle has noncytopathic phenotype and persistently replicates in mammalian cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alphavirus-based vector; nonstructural protein 2; nsP2; replicon; eukaryotic layered initiation system; noncytopathic; gene therapy; persistent replication; recombinant protein expression; gene delivery;
